# Climate change and neuro-psychiatric disease

**Tommaso Filippini**

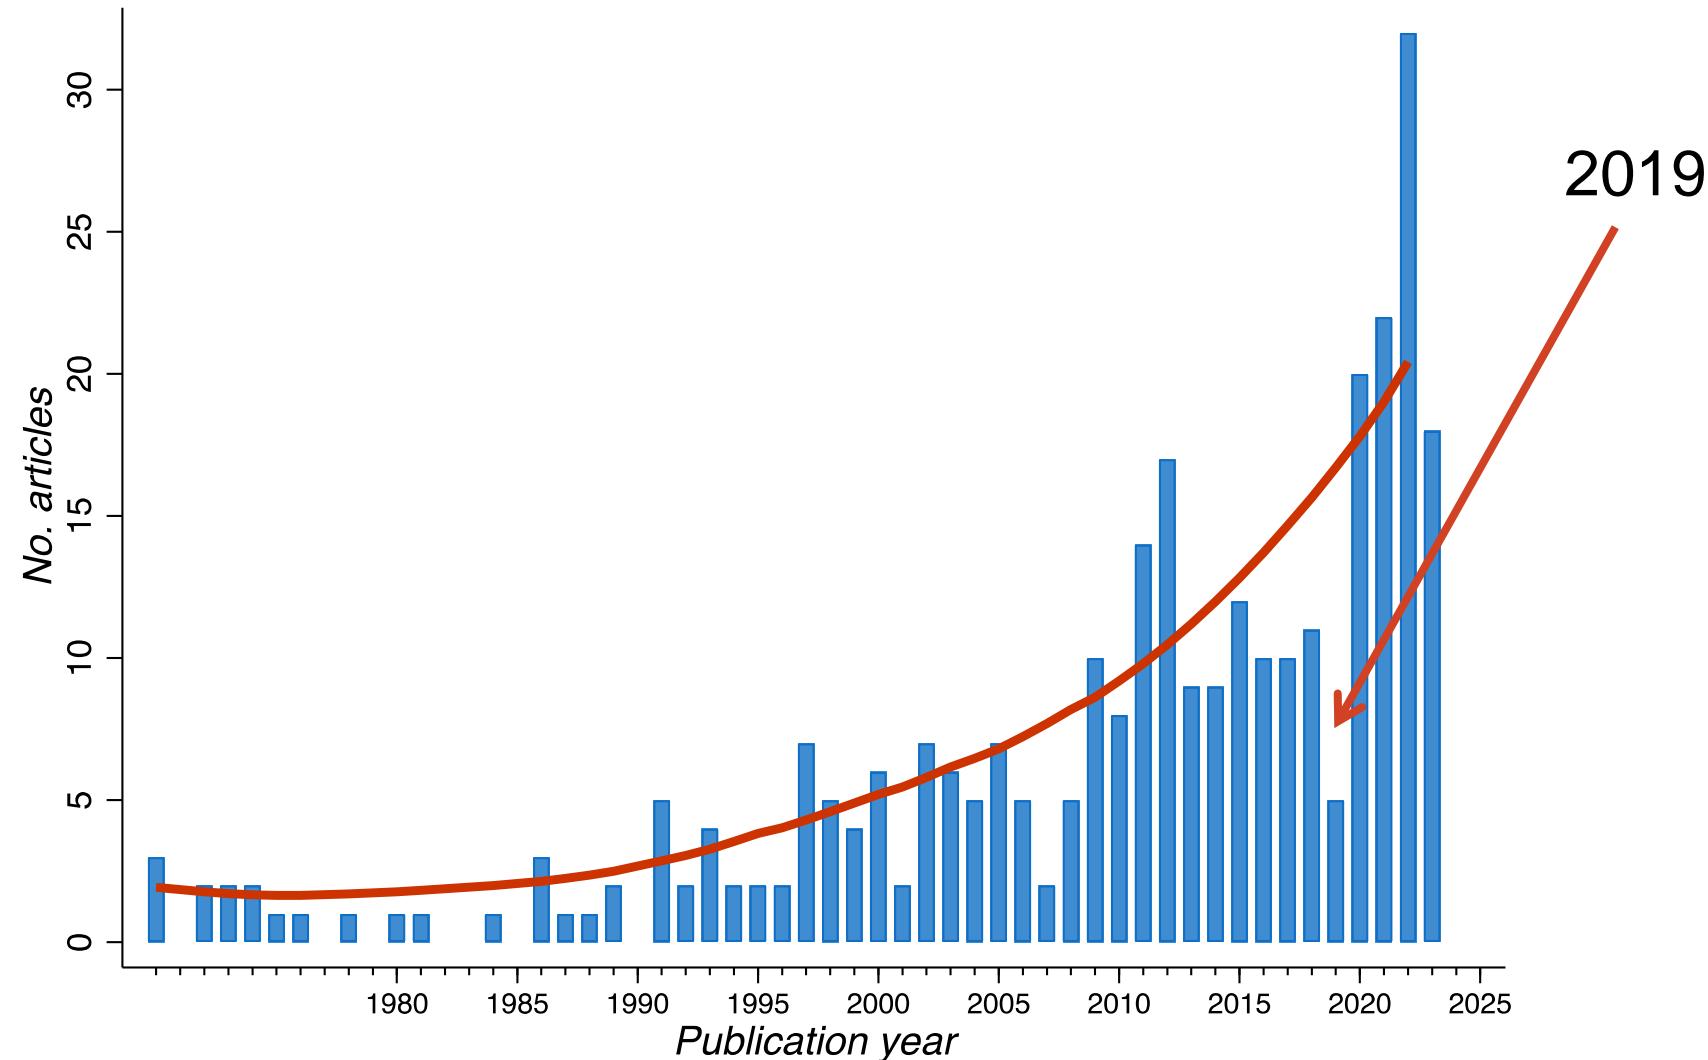

Dipartimento di Scienze Biomediche, Metaboliche e Neuroscienze, UNIMORE

**8 giugno 2023**

Aula Magna ‘Artigianelli’, viale Timavo 93, Reggio Emilia

**Convegno del Gruppo di Lavoto SItI Salute e Ambiente: Climate Change Public Health**

# PubMed results for ‘climate’ and ‘neuro-psychiatric diseases’ in humans

# Compendium of WHO and other UN guidance on health and environment

Are you a decision-maker working in one of these areas?

National, regional and municipal sectors

NGO or development agencies

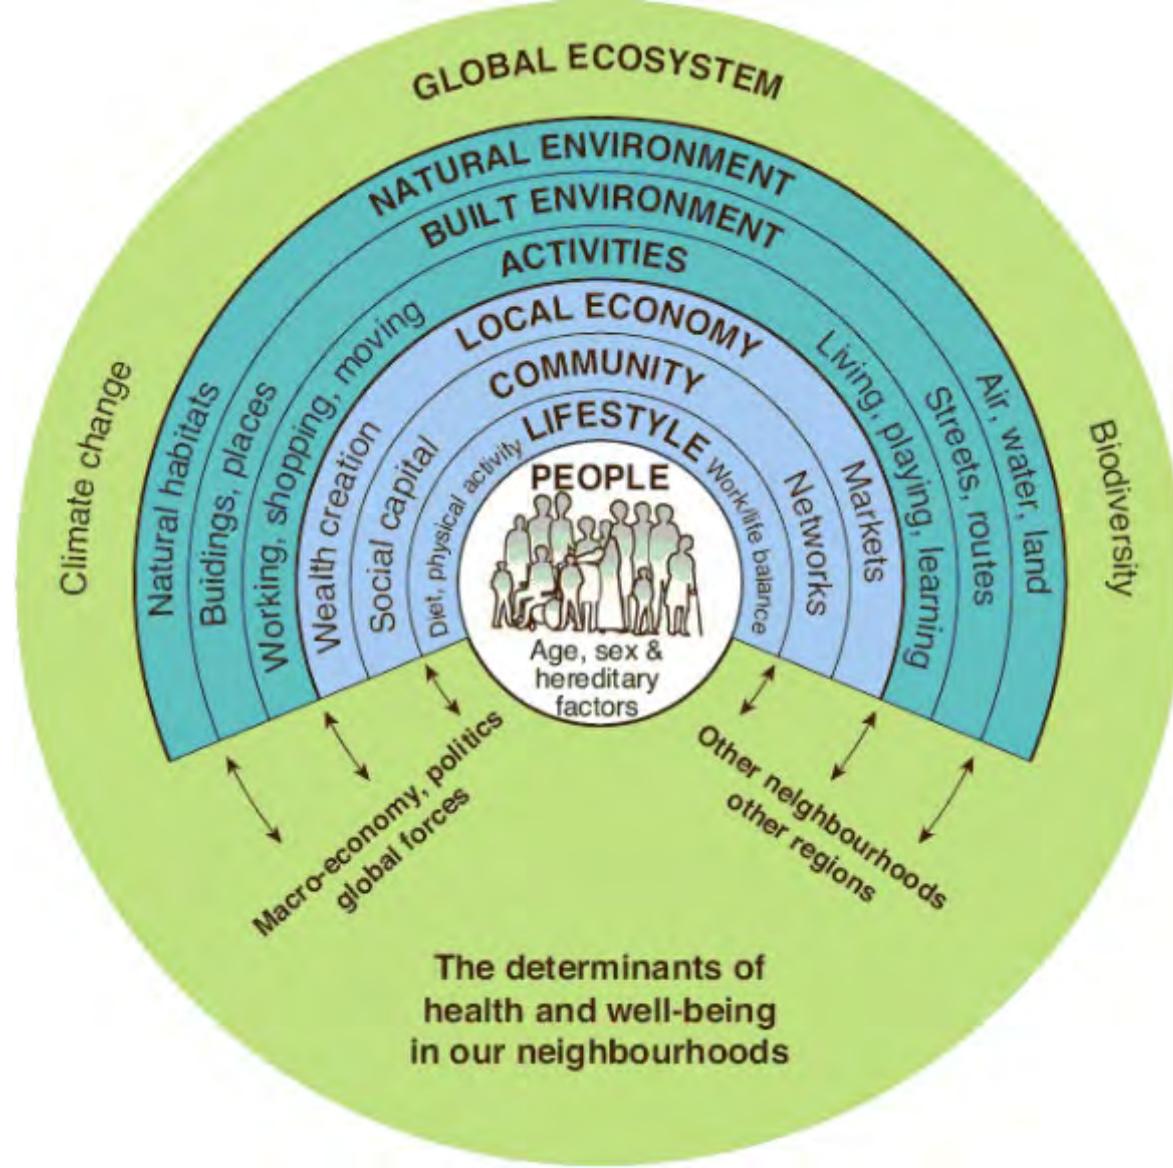

Healthcare

This compendium compiles a comprehensive collection of about 500 interventions for healthier environments that YOU can implement in the following areas:

Access the compendium at <https://www.who.int/tools/compendium-on-health-and-environment>

Policy Rainbow (Dahlgren & Whitehead, 1991)

# Several possible relations between climate change and mental health

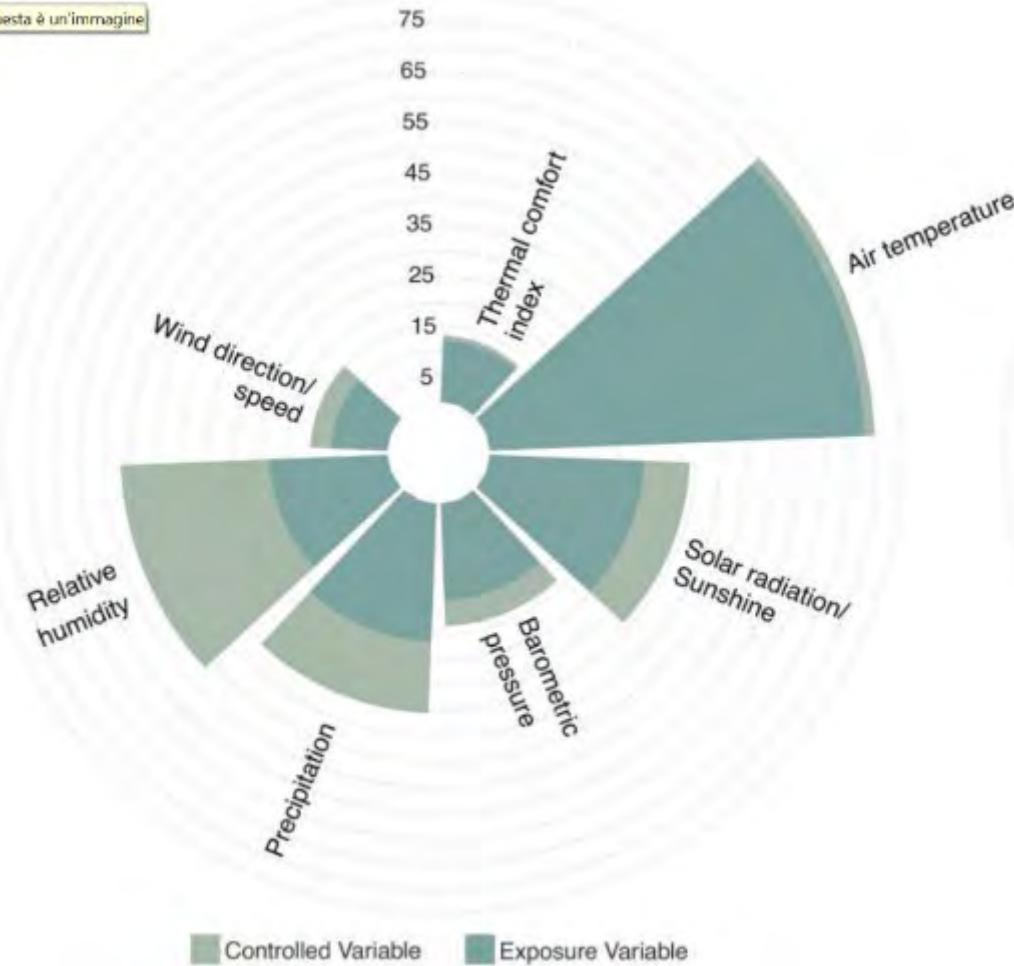

- **direct** impacts (i.e., via extreme heat or weather events such as flooding, wildfires, and hurricanes)
- **indirect** impacts (i.e., due to exacerbation of structural determinants of mental illness such as resource loss, food insecurity, and displacement)
- **overarching** impacts (i.e., pervasive distress, anxiety or grief related to the awareness of the crisis as a major threat to planetary health)

# Climate events and increased mortality risk

Heat events	depression, psychosis, schizophrenia, dementia, substance misuse
Floods	depression, anxiety, paranoid personality disorder, dementia
Wildfires	depression, anxiety
Hurricane	PTSD, ADHD

Luis et al. Neurology 2023

# Higher vulnerability

- The climate crisis worsens existing **inequalities** and disproportionately impacts those with **pre-existing** mental illness and other **structural vulnerabilities**.
- **The elderly, women and children** worldwide are particularly vulnerable to climate-related mental distress, which includes feelings of betrayal and other negative emotions associated with inadequate governmental response to the crisis

# Perspectives

- Earlier evidence focused more on climate attributes and self-reported psychology while recent studies focused on mental and behavioral related **morbidity**
- Methodological gaps include **heterogeneity in climate measures**, assessment of **nonlinear effects** and **co-exposure scenarios**

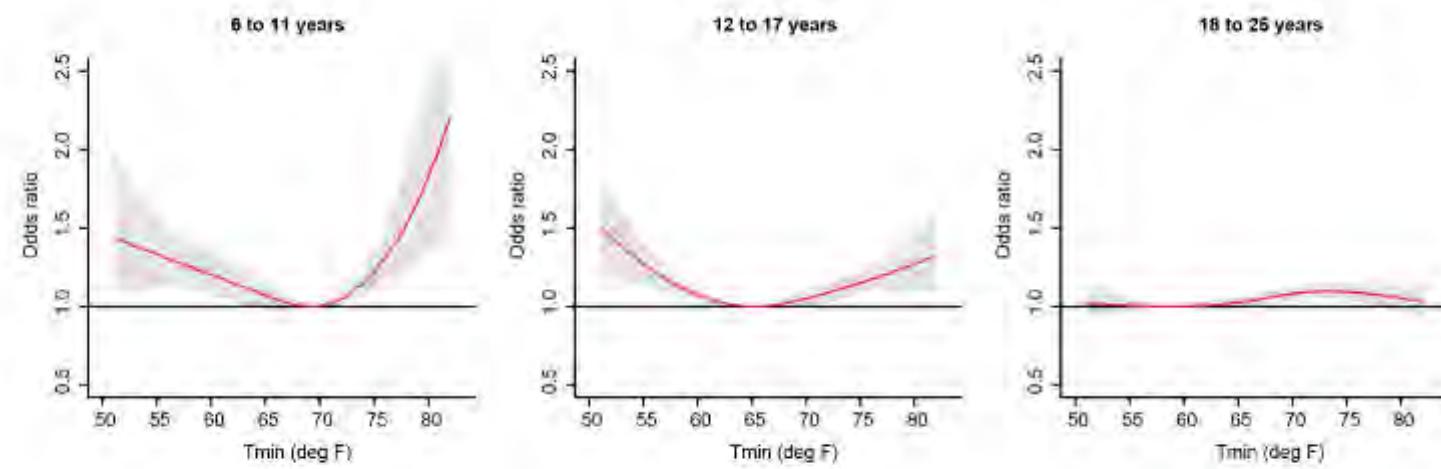

Figure 1. Cumulative odds ratio and 95% confidence intervals of mental health-related ED and hospital admissions associated with daily minimum temperature over lag 0–5 days, June to August.
